JetSchool SEO changelog

Page: Broker map (/brokers)
Date: 6 November 2026
Status: Done

Why this page
The broker map is a public sitemap URL. The title was Broker Map - Jet Finder.
The H1 repeated that label. There was no unique description, no social tags,
no structured data, and no record of searches or profile opens.

Technical
Title is now Find an Aircraft Broker | JetSchool.
Unique meta description explains the airport search and the area counts.
Canonical is /brokers. A query string such as /brokers?q= is noindex, follow.
Open Graph and Twitter summary tags use the JetSchool logo.
JSON-LD CollectionPage lists up to 24 public broker names and places.

Text
H1 is Find an aircraft broker.
The lead says to search by airport code or city, and that a number is how many brokerages
are in that area.
The account note says a brokerage pays $19.99 a month and an added broker does not pay.

Tracking
broker_area_search fires after a search returns, with result_count.
broker_profile_open fires when a brokerage or broker is selected.
Both go to dataLayer. gtag loads only when ANALYTICS_MEASUREMENT_ID is a GA4 id.
No measurement id is set here, so nothing is sent to Google.

Verified
The broker map test checks the title, H1, canonical, CollectionPage, the search event, and
noindex on a query string.
A browser check types an airport search and reads the dataLayer event.
