JetSchool SEO changelog

Page: Home (/)
Date: 6 November 2026
Status: Done

Why this page
The homepage is the first public URL in the sitemap. The old title was Jet Finder - JetSchool.
The page had no H1, no unique description, no Open Graph tags, no structured data, and no analytics.
Filtered URLs such as /?budget= were the same indexable page. /jet-finder rendered a second copy.

Technical
Title is now Compare Private Aircraft by Cost and Range | JetSchool.
Unique meta description says the figures are estimates.
Canonical is the clean homepage. Query-string versions use noindex, follow and the same canonical.
Open Graph and Twitter summary tags point at the homepage and the JetSchool logo.
JSON-LD WebApplication names Jet Finder and JetSchool.
One H1, then H2s for Range Filter, Route Planning, Range Map, and Aircraft Selection Parameters.
The empty marketplace state uses an H3.
/jet-finder now 301-redirects to /.

Text
Visible H1: Compare private aircraft by cost, range, and route.
Intro: Jet Finder ranks business jets and turboprops against routes, passengers, and budget.
The intro says the figures are estimates and should be confirmed before a purchase.

Tracking
dataLayer events: jetfinder_home_airport_search and jetfinder_route_add.
If ANALYTICS_MEASUREMENT_ID is a GA4 id (G-...), gtag loads with anonymize_ip.
No measurement id is set here, so no Google tag is sent.
The variable is documented in .env.example.

Verified
Unit test checks title, H1, canonical, JSON-LD, the route event, noindex on filters, and the 301.
Browser check on the local homepage confirms the H1 and a dataLayer event.
